Assignment 2: Linked Lists and Sets Jake Gendreau February 8, 2024 Program Log

Time Requirements

- This program took me about 2 hours and 15 minutes to implement.
- Getting the first data set to work only took an hour and a half, except the program didn't work with the second data set, so I had to do some more thinking.

Things I encountered while making this program

- Getting used to passing NullPtr by reference was a little confusing, but I got it.
- Reading files was a little confusing at first, but I got the hang of it.
- I initially had it reading off line by line, rather than word by word. This worked fine in the first data set, but got me in the second data set.
- Parsing the second data set for duplicates seemed really daunting at first, until I realized that it would be pretty easy to just check for duplicates as I make the linked lists.
- My debugger didn't work so I spent a while trying to fix that. I didn't fix it.
- I made it take command line args so that I could change the data set without having to recompile.
- I feel like I may have written too many comments, but too many is better than too few.
- GitHub is a lifesaver. Almost lost a whole bunch of work, but version control had my back.
- I didn't expect to have to deal with punctuation, but it was fun to use a little bit of c-string logic to handle that.

Things I encountered making the program design

- LaTeX is really confusing, but fortunately, markdown supports all of the same math expressions, so I have been using that instead.
- Additionally, GitHub uses markdown for the readme.md files, so it's good that I learned it.
- I do better when I make the program design and the actual program at the same time. Actually doing it helps me figure out errors and improvements that could be made.
